Assignment 1

Summary

Coding this assignment has been a fun and streamlined process. Integrating various formulas into the code and meticulously testing them from Jupyter Notebook in order to inevitably include them in a larger KNN ML class felt both dynamic and informative. I wasn't sure at first how the code was supposed to function when it came time to integrate it into a larger whole, but after development, I could see how the components fit together to create the best predictive model available.

There is one issue in my code, however, when it came to importing the wine quality csv file as a pandas data frame. I think because I was using Jupyter Notebook online, it was hard to import that file and use it as part of the notebook until I figured out exactly what I needed to fully utilize it. Still, however, the compilation of this data frame proved to be a bit complex, especially since it needed to be read from properly so that the features of the KNN classifier class could be displayed to full effect. Overall, I had a great time working on this project.
